

The map, redrawn

Panel 1 is the source map corrected: the grant pipeline across three aims, with AI insertions at the exact step they modify — **green** applies an existing tool, **orange** builds a new one. Panel 2 is the layer the source map leaves out: the **fusion core** every producer writes into, read by one query layer.

WHAT CHANGED FROM THE SOURCE MAP

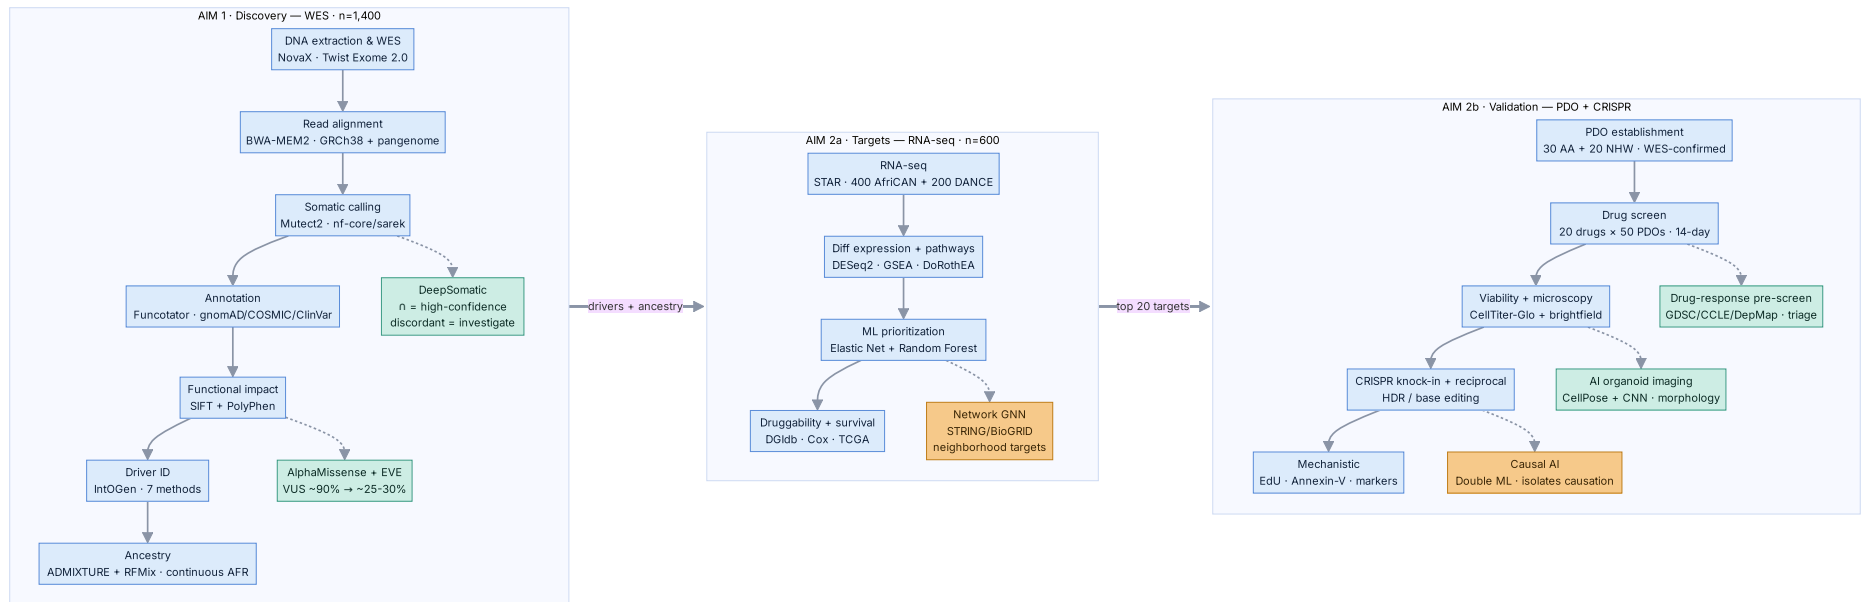

DeepSomatic replaces DeepVariant (somatic tumor-normal, not germline) · concordant **Mutect2** $\cap$ **DeepSomatic** = **high-confidence** set, discordant calls are the investigate set (source had this inverted) · added the **fusion core + query layer** — every producer lands one provenance-tagged object instead of seven separate outputs.

LEGEND

 Grant step  Apply existing AI  Build new AI  Fusion core · the spine  Query & interface  Wet-lab ground truth

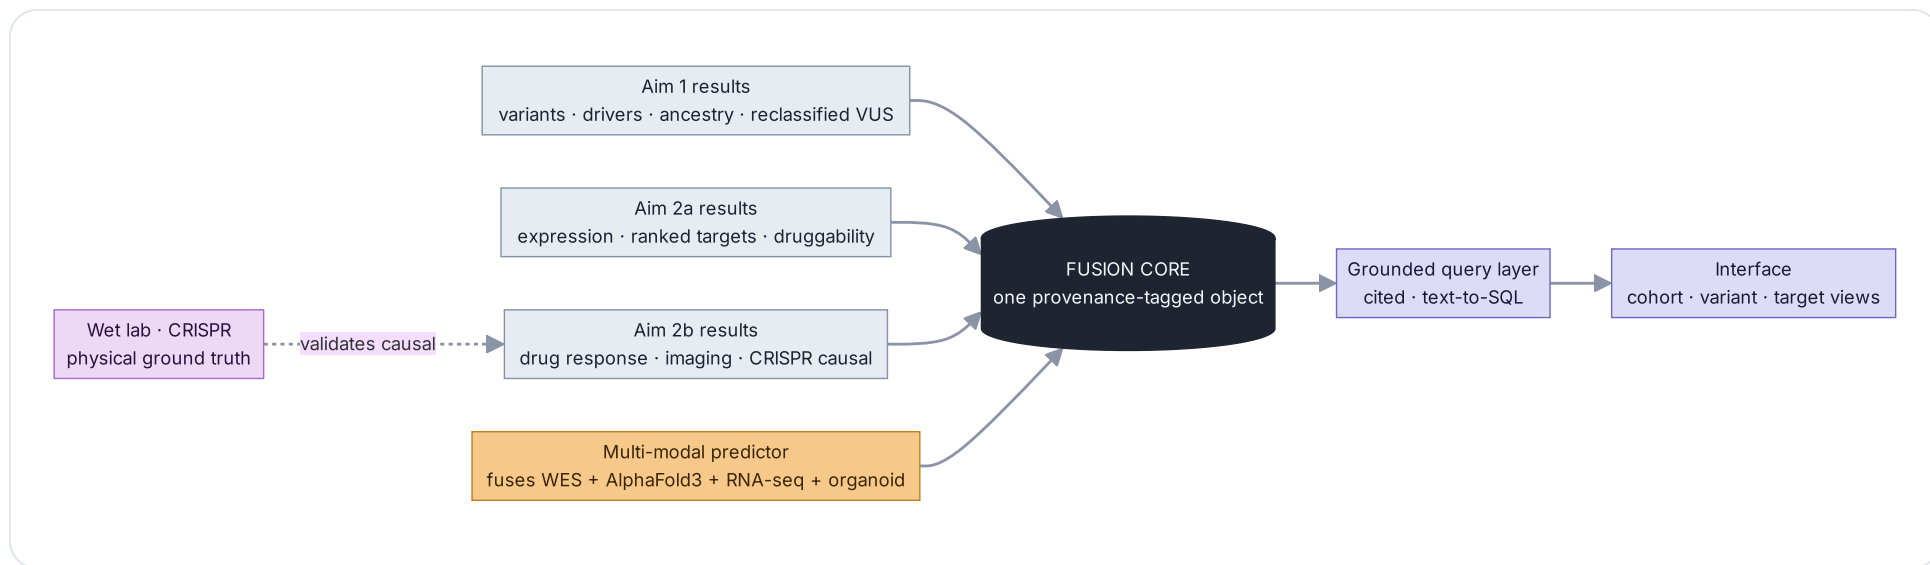

01 The pipeline, corrected

The grant's own steps in **blue**, flowing discovery → targets → validation. AI attaches where the grant text already names a method it upgrades.

02 The spine it's missing

Every aim's output — plus the cross-cutting multi-modal predictor — lands in one **provenance-tagged object**, read by a single grounded query layer. The wet lab is the physical ground truth that validates the causal claims.

Companion to `AfriCAN_DANCE_Build_Plan.md` and the build graphs. Panel 1 is the grant-facing story (AI at each named step); Panel 2 is the build-and-ownership story (the fusion-core spine underneath).
